Prepared by Aethelred Foundation
Ramesh Tamilselvan, Founder

1. Executive Summary

Aethelred is a sovereign Layer 1 blockchain optimized for verifiable AI computation. The AETHEL token powers the Proof-of-Useful-Work (PoUW) consensus mechanism and serves as the primary economic utility token for the Aethelred ecosystem. The tokenomics design is anchored in five core principles:

• **Fixed Supply, No Inflation:** A hard cap of 10 billion AETHEL tokens ensures absolute scarcity. All tokens are minted at genesis; no additional minting or inflation mechanisms exist.

• **Deflationary Pressure:** A triple-burn mechanism (base fee burn, congestion-squared burn, and adaptive quadratic burn) systematically removes tokens from circulation, creating upward price pressure.

• **Conservative Float:** Only 6.3% of the total supply (630 million AETHEL) circulates at Token Generation Event (TGE), with the remainder locked under multi-year vesting schedules.

• **Economic Security:** A four-tier slashing framework and reputation-based validator economics create strong incentives for honest participation and deter malicious behavior.

• **Institutional Grade:** OFAC-compliant architecture, multi-signature governance, and formal verification ensure institutional readiness for sovereign wealth fund deployment.

Key Metrics Overview

Metric	Value	Unit
Total Supply	10,000,000,000	AETHEL
Inflation Model	None (Fixed Cap)	—
TGE Circulating Supply	630,000,000	AETHEL
TGE Float Percentage	6.3%	—
TGE Price (Reference)	$0.10	USD
Fully Diluted Valuation at TGE	$1,000,000,000	USD
Market Cap at TGE	$63,000,000	USD
Total Fundraise	$16,000,000	USD
Average Entry Price (Weighted)	$0.0194	USD
Fee Burn Rate	20%	—
Byzantine Fault Tolerance	67%	—
Maximum Validators	100	—
Minimum Validator Stake	50,000	AETHEL

2. Token Overview

The AETHEL token is the native utility and governance token of the Aethelred network. It operates across multiple execution environments (EVM-compatible and Cosmos SDK) with unified economics.

Token Identity and Technical Specifications

Property	Value
Token Name	Aethelred
Token Ticker	AETHEL
EVM Implementation	ERC-20 (Upgradeable)

EVM Extensions	ERC-20Votes, ERC-20Permit (EIP-2612), Burnable, Pausable, UUPS Upgradeable
Decimal Places (EVM)	18 (wei denomination)
Cosmos Denomination	uaethel (6 decimals)
Scale Factor	10^{12}
EVM Chain ID	8821
Cosmos Chain ID	aethelred-1

Multi-Layer Denomination System

The AETHEL token employs a multi-layer denomination system ensuring compatibility across EVM and Cosmos environments while maintaining unified economic semantics:

Denomination	Value	Use Case
AETHEL	1.0 unit	User-facing, human-readable amounts
uaethel	10^{-6} AETHEL	Cosmos SDK standard (6-decimal native)
wei	10^{-18} AETHEL	Smart contract precision (EVM 18-decimal)

Token Capabilities

• **ERC-20 Standard:** Full OpenZeppelin ERC-20 implementation for EVM compatibility and exchange support.

• **Voting Delegation:** ERC-20Votes extension enabling delegation without token transfer, ideal for governance.

• **Permit Signature:** EIP-2612 permit() function allowing gasless token approvals via EIP-712 signatures.

• **Burnable:** Public burn() function enabling deflationary mechanisms and holder-initiated token destruction.

• **Pausable:** Emergency pause capability for regulatory compliance or security incident response.

• **UUPS Upgradeable:** Universal Upgradeable Proxy Standard (EIP-1822) for non-breaking protocol improvements.

• **Compliance Module:** Integrated compliance layer supporting OFAC list checks and jurisdiction-based restrictions.

• **Bridge Integration:** Native bridge-safe design supporting future cross-chain atomic swaps.

• **Transfer Restrictions:** Optional time-based and amount-based restrictions for vesting enforcement.

3. Supply Architecture

The AETHEL tokenomics model features a fixed, immutable total supply of 10 billion tokens with zero inflation. This hard-cap design eliminates monetary dilution and creates absolute economic scarcity.

Supply Constraints

Property	Value	Immutability
Total Supply Cap	10,000,000,000 AETHEL	Immutable Constant
Genesis Minting	100% at Genesis	Single-Event Only
Additional Minting	None (Impossible)	Permanently Disabled
Inflation Rate	0.00%	No Mechanism
Supply Reduction	Deflationary Burn Only	Active (20%+ of Fees)

The immutable **TOTAL_SUPPLY_CAP** constant in the token contract encodes this commitment at the bytecode level. No governance mechanism can override this supply cap; any such change would require a complete token contract

replacement and community consensus, effectively creating a new token.

Genesis Distribution

All 10 billion AETHEL tokens are minted once, at network genesis. They are immediately distributed according to the allocation framework specified in Section 4. No additional minting events, inflationary releases, or emergency issuances are possible.

Circulating Supply at TGE

While all 10 billion tokens exist at genesis, only 630 million (6.3%) are *circulating* at TGE. The remainder are subject to multi-year vesting schedules, creating a conservative float that minimizes price volatility and aligns long-term incentives.

4. Token Allocation & Distribution

The 10 billion AETHEL token supply is strategically allocated across nine categories, balancing incentives for core contributors, ecosystem participants, and protocol security. This allocation ensures long-term sustainability while maintaining fair value distribution.

Full Allocation Table

Category	Percentage	AETHEL Tokens	TGE Unlock	Vesting	
PoUW Rewards	30%	3,000,000,000	0	50Y Linear	Block rewards & validator incentives
Core Contributors	20%	2,000,000,000	0	4Y Cliff-Linear	Engineering, product, operations team
Ecosystem Grants	15%	1,500,000,000	50,000,000	3Y Linear	Developer ecosystem & DApps
Treasury & MM	6%	600,000,000	300,000,000	6M Linear	Treasury ops & market making
Public Sales	7.5%	750,000,000	350,000,000	1Y Linear	Community & institutional sales
Airdrop (Seals)	7%	700,000,000	0	DAO-Controlled	Community engagement & loyalty
Strategic/Seed	5.5%	550,000,000	0	4Y Cliff-Linear	Early investors & strategic partners
Insurance Fund	5%	500,000,000	0	2Y Linear	Protocol security & slashing reserves
Contingency	4%	400,000,000	0	DAO-Controlled	Future opportunities & governance

Allocation Rationale

PoUW Rewards (30%): Comprises the entire validator reward pool over 50 years. This ensures a sustainable, predictable stream of incentives for consensus participants and network security. The 50-year release timeline aligns with long-term network maturity.

Core Contributors (20%): Allocated to the founding team, engineers, and key operational staff. A 4-year cliff-linear schedule (no unlock for 12 months, then linear over 4 years) ensures team continuity and long-term alignment with the protocol's success.

Ecosystem Grants (15%): Funds developer incentives, hackathons, and ecosystem building. A 3-year linear schedule with 50M tokens unlocking at TGE enables immediate grant disbursement while locking remaining incentives.

Treasury & Market Making (6%): Operational liquidity for treasury management and market maker initial funding. 300M AETHEL unlocks at TGE; remainder vests over 6 months to align MM incentives with long-term protocol health.

Public Sales (7.5%): Community-accessible token sales at fixed prices. 350M AETHEL unlocks at TGE; remainder vests linearly over one year to create sustained buying pressure and prevent immediate sell-off.

Airdrop/Seals (7%): Community engagement through tiered airdrop claims. Controlled by DAO governance; initially locked to prevent market dump and enable community voting on distribution parameters.

Strategic/Seed (5.5%): Early-stage investors and strategic partners receive tokens under 4-year cliff-linear schedules, aligning their incentives with protocol maturity and creating experienced long-term stakeholders.

Insurance Fund (5%): Reserves for slashing, security incidents, and protocol insurance. 2-year linear schedule ensures capital availability for underwriting while avoiding large immediate balances.

Contingency (4%): DAO-controlled pool for unforeseen opportunities, hard forks, or governance-approved allocations. No time-based unlock; released only by explicit DAO vote.

5. Vesting Schedules

Vesting schedules govern the progressive unlock of allocated tokens over specified periods. This mechanism aligns long-term incentives, reduces sell pressure, and ensures sustainable circulating supply growth.

Vesting Schedule Parameters

Category	TGE Unlock %	Cliff Period	Linear Period	Total Duration	Monthly Unlock	End Date
Core Contributors	0%	12 months	36 months	48 months	41.67M AETHEL	Mar 2030
Ecosystem Grants	3.33%	0 months	36 months	36 months	41.67M AETHEL	Mar 2029
Treasury & MM	50%	0 months	6 months	6 months	50M AETHEL	Sep 2026
Public Sales	46.67%	0 months	12 months	12 months	33.33M AETHEL	Dec 2027
Strategic/Seed	0%	12 months	36 months	48 months	11.46M AETHEL	Mar 2030
Insurance Fund	0%	0 months	24 months	24 months	20.83M AETHEL	Mar 2028
PoUW Rewards	0%	0 months	600 months	600 months	5M AETHEL	Dec 2076

Vesting Formula

For a beneficiary with allocation A, TGE unlock u, cliff period c, and linear period l, the vested amount at time t (in months since TGE) is:

$$vested(t) = A \times u + A \times (1 - u) \times \max(0, \min(1, (t - c) / l))$$

Key properties: (1) **Monotonicity:** vested(t) is non-decreasing in t. (2) **Boundedness:** 0 <= vested(t) <= A for all t. (3) **Solvency:** Total vested across all beneficiaries never exceeds total supply.

Vesting Schedule Types

Type	Parameters	Use Case	Example
Linear	TGE u, linear l	Uniform unlock over time	Ecosystem Grants: 50M/month over 36 months
Cliff-Linear	Cliff c, linear l	Delayed start, then linear	Core Contrib: 12m cliff, then 36m linear
Immediate	TGE u = 1.0	Full unlock at TGE	Public Sales: 46.67% instant access
DAO-Controlled	Custom governance logic	Discretionary release	Airdrop/Seals: DAO votes on unlock timing
Milestone-Based	Achievement conditions	Conditional unlock	Contingency: unlocks on protocol milestones

6. Circulating Supply Projection

The circulating supply grows predictably as vesting schedules unlock and deflationary mechanisms remove tokens from the supply. This table projects circulating supply through Month 120 (10 years).

Supply Projection (Selected Months)

Month	Vested (M AETHEL)	Burned (M AETHEL)	Circulating (M AETHEL)	% of Total
0	630	0.0	630	6.3%
6	780	15.0	765	7.6%
12	930	30.0	900	9.0%

24	1230	60.0	1170	11.7%
36	1530	90.0	1440	14.4%
48	1830	120.0	1710	17.1%
60	2130	150.0	1980	19.8%
72	2430	180.0	2250	22.5%
84	2730	210.0	2520	25.2%
96	3030	240.0	2790	27.9%
108	3330	270.0	3060	30.6%
120	3630	300.0	3330	33.3%

Note: This projection assumes average fee burn of 2.5M AETHEL per month. Actual burn depends on network activity and fee market dynamics. As network adoption increases, fee burn accelerates, potentially reducing circulating supply below these projections.

7. Fundraising Breakdown

Aethelred raised $16 million across four rounds, establishing a diverse investor base and conservative initial valuation trajectory.

Fundraising Rounds Summary

Round	Amount	Price/AETHEL	FDV	Tokens	% of Raise	Status
Seed	$1,000,000	$0.0100	$100M	100M	6.25%	Closed
Echo	$6,000,000	$0.0150	$150M	400M	37.50%	Closed
Strategic	$3,750,000	$0.0250	$250M	150M	23.44%	Closed
Exchange	$5,250,000	$0.0300	$300M	175M	32.81%	Closed
Total	$16,000,000	Avg $0.0194	$800M Blended	825M	100%	—

Use of Proceeds

Category	% of Budget	Amount	Description
Engineering	40%	$6,400,000	Protocol development, core infrastructure, consensus implementation
Infrastructure	15%	$2,400,000	Network operations, validator tooling, cloud infrastructure
Security & Audit	15%	$2,400,000	Formal verification, third-party audits, bug bounties
Business Development	10%	$1,600,000	Exchange integrations, strategic partnerships, brand
Legal & Compliance	10%	$1,600,000	Regulatory filings, ADGM licensing, legal framework
Operations	10%	$1,600,000	HR, finance, admin, facilities, team expansion

Investor Returns at TGE

Round	Entry Price	TGE Price	Return	ROI %
Seed	$0.0100	$0.1000	10.00x	900%
Echo	$0.0150	$0.1000	6.67x	567%
Strategic	$0.0250	$0.1000	4.00x	300%
Exchange	$0.0300	$0.1000	3.33x	233%

8. TGE Metrics

The Token Generation Event (TGE) is scheduled for December 7–10, 2026, marking the public listing of AETHEL on primary and secondary exchanges. This section defines key metrics at TGE.

TGE Snapshot (December 7–10, 2026)

Metric	Value
Total Supply	10,000,000,000 AETHEL
Circulating Supply	630,000,000 AETHEL
Float Percentage	6.3%
Reference Price	$0.10 USD per AETHEL
Market Capitalization	$63,000,000 USD
Fully Diluted Valuation	$1,000,000,000 USD
Total Investor Tokens	825,000,000 AETHEL
Institutional Tokens	650,000,000 AETHEL (78.8% of investor base)
Total Network Validators	67 (BFT-ready)
Average Validator Stake	746,269 AETHEL
Total Staked	50,000,000 AETHEL (0.5% of supply)

Float Analysis vs. Industry Benchmarks

A 6.3% initial float is significantly lower than typical L1 blockchain TGEs (which commonly range from 10–50%), reducing immediate sell pressure and ensuring conservative market entry. This positions Aethelred as an institutional-grade offering with carefully managed supply dynamics.

9. Airdrop Program (Seals)

The Airdrop, branded as the Seals program, allocates 700 million AETHEL (7% of total supply) to community participants based on testnet engagement, ecosystem participation, and early-stage loyalty.

Seal Tier Structure

Tier	Allocation per User	Number of Users	Total AETHEL	Requirements
Diamond	50,000 AETHEL	500	25,000,000	Top testnet performers, core contributors
Gold	20,000 AETHEL	2,000	40,000,000	Active testnet participation, validator setup
Silver	5,000 AETHEL	10,000	50,000,000	Testnet engagement, community participation
Bronze	500 AETHEL	50,000	25,000,000	Echo registration, community presence

Additional Allocations

Program	AETHEL Tokens	Purpose
Ongoing Incentives	210,000,000	Monthly community grants, governance incentives
Testnet Bonus	100,000,000	Validator setup, node operation, feedback
Echo Early Registration	50,000,000	Community members registered before March 15, 2026
DAO Contingency	275,000,000	Governance-controlled reserve for future distribution

Airdrop Timeline

Date/Period	Event
March 2026	Seals Program Launch
March–May 2026	Community Onboarding & Testnet Participation
May 2026	Testnet Milestone (Validator Setup Period)
September 2026	Snapshot Preparation (Final community engagement window)
November 2026	Airdrop Snapshot (Claim eligibility snapshot)
December 2026	TGE Airdrop Distribution (AETHEL tokens credited to wallets)

10. Staking Economics

Staking is the primary mechanism for network security and validator revenue generation. Participants stake AETHEL to become validators, earn block rewards, and protect network integrity.

Staking Parameters

Parameter	Value	Rationale
Minimum Validator Stake	50,000 AETHEL	~$5,000 USD equivalent; prevents spam; aligns with enterprise participation
Minimum Delegator Stake	100 AETHEL	Low barrier for retail; enables broad participation
Maximum Active Validators	100	Maintains decentralization; Byzantine quorum at 67 validators
Validator Commission Range	5% – 20%	Market-driven reward distribution; prevents extractive practices
Unbonding Period	21 days	Security: prevents rapid exit after slashing events
Staking Target Ratio	55%	Equilibrium between security and economic efficiency
Reputation Score Range	0 – 100	Metrics-based validator performance evaluation
TEE Compute Bonus	1.5x	Incentivizes trusted execution environment adoption

Staking Yield Projections

Staking Ratio	Daily Fee Revenue	Annual Yield (20% commission)	Annual Yield (10% commission)
30%	~$5,000	~15.2%	~30.4%
40%	~$8,000	~18.2%	~36.4%
50%	~$12,000	~22.1%	~44.2%
55%	~$15,000	~24.7%	~49.4%
60%	~$18,000	~27.3%	~54.6%
70%	~$25,000	~32.8%	~65.6%

Yields vary based on network fee revenue. Conservative projections assume $5,000–$25,000 daily fees; high-volume networks may achieve 2–3x higher yields. Validator commission varies from 5% (low-fee) to 20% (competitive market), resulting in delegator yields of 15%–55% APY.

11. Economic Security Analysis

Economic security in Aethelred is measured by the cost of attacking the network through Byzantine-fault-tolerant consensus mechanisms. A secure network requires the cost of attack to exceed potential economic gains.

Attack Cost Analysis (at TGE, 55% Staking Ratio)

Attack Type	Stake Required	USD Value @ $0.10	Duration
BFT Safety (67%)	5.5B AETHEL	$550M	Permanent network halt
Majority (50% + 1)	5.5B AETHEL	$550M	51% attack; transaction censorship
Supermajority (66.67%)	6.67B AETHEL	$667M	Byzantine-fault tolerance override

Key Security Invariants

• **SI-01 – Supply Boundedness:** Total circulating supply <= 10B AETHEL, enforced by immutable TOTAL_SUPPLY_CAP.

• **SI-02 – Vesting Monotonicity:** Vested balance never decreases; only increases or stays constant.

• **SI-03 – Slashing Irreversibility:** Slashed stake burned permanently; cannot be recovered or restored.

• **SI-04 – Fee Collection Completeness:** 100% of transaction fees collected; 20%+ burned, remainder to validators/treasury/insurance.

• **SI-05 – Validator Integrity:** Validator signature key never in user possession; multi-sig for critical operations.

• **SI-06 – Bridge Finality:** Cross-chain transfers atomic; on-chain commitment irreversible after Ethereum finality.

• **SI-07 – Governance Timelocks:** All parameter changes subject to 48-hour timelock; emergency override requires 3-of-5 multisig.

• **SI-08 – Reputation Decay:** Validator reputation decays monthly if node offline; prevents validator takeover via reputation hoarding.

• **SI-09 – Deflationary Guarantee:** Fee burn >= 20% of all fees; asymmetric burn on congestion creates long-term price floor.

• **SI-10 – Consensus Threshold:** 67% (67 of 100) validator quorum required for finality; impossible for <50% stake to cause harm.

12. Governance Framework

Aethelred employs a bicameral governance structure combining token-holder voting (House of Tokens) with validator voting (House of Sovereigns), ensuring both capital and operational stakeholders have voice.

Governance Architecture

Chamber	Composition	Voting Power	Quorum	Supermajority
House of Tokens	AETHEL token holders	1 token = 1 vote	4%	66.67%
House of Sovereigns	Top 50 validators	1 validator = 1 vote	33 validators	34 validators

Parameter Governance Tiers

Tier	Requirements	Examples	Approval Method
Mutable	Majority in both chambers	Fee parameters, commission bounds	Standard vote
Locked	Supermajority + 48h timelock	Staking ratios, slashing rates	Timelock vote
Critical	3-of-5 multisig + governance vote	Emergency pause, validator removals	Multisig consensus
Immutable	Impossible (hardcoded)	TOTAL_SUPPLY_CAP, decimal precision	N/A (bytecode)

13. Fee Market Design

Aethelred employs a dynamic fee market inspired by EIP-1559, combining base fees, priority fees, and hardware/jurisdiction multipliers to optimize network utilization and create sustainable validator incentives.

Fee Component	Base Value	Range	Purpose
Base Fee	0.001 AETHEL	0.0001 – 0.001 AETHEL	Minimum network cost; burned (20%)
Priority Multiplier	1x – 5x	1x (standard) to 5x (urgent)	Priority queue sorting
Hardware Multiplier	1x – 2x	Generic to H100 TEE cluster	Compute resource pricing
Jurisdiction Multiplier	1x – 1.5x	Global to Saudi Arabia	Regulatory compliance surcharge

14. Deflationary Mechanisms

Three complementary burn mechanisms create a deflationary pressure that reduces circulating supply and creates upward price pressure as network adoption accelerates.

Mechanism	Trigger	Burn Rate	Annual Estimate @ $5K Daily Fees
Base Fee Burn	Every transaction	20% of base fees	~365M AETHEL / year
Congestion-Squared Burn	Network load > 70%	sqrt(utilization) x base fee	~150M AETHEL / year (high load)
Adaptive Quadratic Burn	Oracle-triggered	5% – 20% of fees	~100M AETHEL / year (baseline)

17. Governance Economics

Bi-Cameral Governance Structure

Aethelred employs a bi-cameral governance model with two independent bodies: the House of Tokens (stake-weighted voting) and the House of Sovereigns (one-validator-one-vote). Both must approve critical protocol changes, ensuring balance between capital and infrastructure providers.

Parameter	Bootstrap (0-2w)	Active (2w+)
Voting Period	3.5 days	7 days
Quorum Requirement	33%	40%
Max Proposals	10	20
Approval Threshold	50% + 1	66.67%

Parameter Governance Tiers

Tier	Approval %	Examples
Mutable	67%	Fee multipliers, priority boost values
Locked	80%	Slashing rates, staking minimums
Critical	90%	Supply cap, consensus threshold
Immutable	N/A	Token standard (ERC-20), core cryptography

The Council comprises 9 elected members serving 1-year staggered terms (3 elected annually). Council members propose constitutional amendments and manage the treasury allocation framework.

18. Bridge Economics

Aethelred implements a lock-and-mint cross-chain bridge with rigorous economic safeguards, 4-dimensional rate limiting, and a vote-snapshot challenge mechanism to prevent unauthorized minting.

Parameter	Value	Purpose
Min Deposit	0.01 ETH	Dust prevention
Max Deposit	100 ETH	Single-transaction ceiling
Rate Limit	1000 ETH/hour	Hourly throughput cap
Challenge Period	7 days	Dispute resolution window
Confirmations	64 ETH blocks	Finality threshold
Guardian Threshold	2-of-N	Multisig emergency pause
Upgrade Timelock	27 days	Governance delay
Per-Block Mint Ceiling	10 ETH	Block-level safeguard

Rate Limiting: Four complementary dimensions: per-user hourly, per-user daily, per-validator-pair, and global aggregate. Challenge mechanism uses vote-snapshot approach: any transaction challenged within the 7-day period triggers Merkle tree re-evaluation.

19. Institutional Stablecoin Infrastructure

Aethelred provides zero-liquidity-pool routing via CCTP V2 for USDC and TEE Issuer Mint for institutional stablecoins, with comprehensive risk management and governance controls.

Risk Management Parameters

Control	Value	Rationale
Per-Epoch Mint Ceiling	50M USD	Prevents single-epoch dominance
Daily Transaction Limit	100M USD	Aggregate daily cap
Hourly Outflow Velocity	25M USD/hr	Rate-limited exit protection
Daily Outflow Velocity	75M USD/day	Multi-hour drain prevention
Chainlink PoR	Daily refresh	Attestation frequency
Oracle Heartbeat	6 hours	Staleness threshold

Governance Keys (5 total): Issuer, Issuer Recovery, Foundation, Auditor, Guardian. 3-of-5 threshold required for mint authorization. Relayer bonding requirement: 500,000 AETHEL per active relayer.

20. AI Compute Market Economics

Job Lifecycle

Jobs transition through states: Submitted -> Assigned -> Proving -> Verified -> Settled (or Failed/Cancelled). Each state transition triggers economic events: fee collection, reward distribution, and potential slashing.

Parameter	Value
Jobs per Block	25
Jobs per Validator	3 max
Timeout	50 blocks
Expiry	14400 blocks (~24 hours)
Min Verifiers	3
Max Retries	3
Verification Reward	100 µaeth

Priority Scheduling: effective_priority = base_priority + (wait_blocks x boost). Three verification types: TEE (High), ZKML (High), Hybrid (Highest). Digital Seal minting requires >=2/3+1 consensus. Tensor precompiles use logarithmic gas: gas_cost = base_gas x log2(tensor_size).

21. Validator Economics

Revenue Streams (5 Total)

Stream	Monthly (est.)	Description
PoUW Block Rewards	25M AETHEL	Consensus participation
Job Fees	40% of market	Compute transaction fees
Verification Rewards	100 µaeth/job	Proof verification
TEE Compute Bonus	1.5x multiplier	Hardware-sealed tasks
Commission	5–20%	User-facing staking commission

Cost Structure

Hardware: TEE-capable nodes (AWS Nitro, Intel SGX). Staking Capital: minimum 50,000 AETHEL (~$5K). Operational: bandwidth (1 Gbps minimum), storage (2TB SSD), operational overhead (staff, infrastructure). Onboarding threshold: 80-point evaluation (uptime history, hardware spec, geographic diversity, operator experience).

22. Economic Security Analysis

Aethelred assumes Byzantine Fault Tolerance (BFT) with >=2/3 honest stake. Attack costs scale non-linearly with acquisition of stake, making supermajority attacks economically deterring.

Attack Cost Analysis (55% Staking, $0.10/AETHEL)

Attack Type	Stake Required	Token Cost	USD Cost	Slash Result
BFT (66.7%)	2.75B AETHEL	1.83B + 1.92B	$183M + $192M	100%
Majority (51%)	4.13B AETHEL	2.75B + 2.75B	$275M + $275M	100%
Supermajority (80%)	5.5B AETHEL	3.67B + 3.67B	$367M + $367M	100%

Security Invariants (10 Total)

• SI-01: Supply never exceeds 10B AETHEL cap

• SI-02: Fee distribution <= 10000 BPS (100%)

• SI-03: Vesting curves are monotonically non-decreasing

• SI-04: All issued tokens remain in contract solvency proofs

• SI-05: Slashing deterrence ratio > 1 (gain cannot exceed risk)

• SI-06: Consensus honesty assumption >= 66% maintained

• SI-07: Double-spend prevention via canonical ordering

• SI-08: Rate limits enforced per-epoch per-user

• SI-09: Per-block ceilings (mint, burn, fee) never exceeded

• SI-10: AllowSimulated flag = false (no simulation attacks)

Adversary Classes: Solo attacker, Coordinated minority, Rogue validator coalition, Cross-chain bridge exploiter, Economic 51% attacker.

23. Post-Quantum Cryptographic Considerations

Aethelred implements a hybrid cryptographic scheme to provide classical and quantum-resistant security. The system uses ECDSA secp256k1 for classical security (128-bit) alongside post-quantum algorithms.

Cryptographic Scheme

Algorithm	Quantum Strength	Classical Strength	Use Case
ECDSA secp256k1	None	128-bit	Transaction signing
Dilithium3 (ML-DSA-65)	128-bit	Implicit	Post-quantum signatures
Kyber768 (ML-KEM-768)	128-bit	Implicit	Post-quantum KEM

Economic Implications: Larger signatures (+256 bytes), dual verification overhead (~5% CPU), HSM costs: AWS CloudHSM (~$0.30/hr), Thales Luna (~$25K/unit), YubiHSM 2 (~$500/unit). Panic Mode trade-off: disable classical ECDSA under quantum threat to save computation. Key management uses ZeroizeOnDrop to ensure cryptographic material destruction.

24. Formal Verification & Audit

Audit Engagements

Firm	Scope	Status	Cycles
Trail of Bits	Contracts, consensus, crypto	Engaged	2
OtterSec	Contracts, bridge, tokenomics	Engaged	2
Internal	Full protocol	Complete	27 findings remediated
External VRF	VRF cryptography	Complete	RS-01 Critical fixed

Formal Verification Coverage

Tier 1 (Interactive Theorem Proving): AethelredToken, Vesting, Bridge, Governance contracts verified via Certora and Halmos. 5 Token invariants, 4 Vesting invariants, 3 Bridge invariants verified.

Tier 2 (SMT Solvers): Tokenomics and VRF Rust code via Kani model checker. Covers randomness generation, fairness, and economic constraints.

Tier 3 (Model Checking): Consensus protocol (BFT) specified in TLA+. Liveness and safety properties proven.

Internal Audit Results: 3 Critical, 5 High, 8 Medium, 7 Low, 6 Info findings. All 27 findings remediated and verified closed.

Test Coverage: 57 tokenomics tests, 44 ecosystem tests, comprehensive job state machine tests, 435+ total tests with >85% code coverage.

25. Mainnet Launch Economics

Mainnet readiness is evaluated via 10 blocking checks and a Go/No-Go decision framework with weighted scoring across six dimensions.

Readiness Checks (R-01 to R-10)

- R-01: All audit findings (internal + external) remediated and verified
- R-02: Testnet has operated stably for >=4 weeks without unplanned restarts
- R-03: Mainnet validators (>=20) confirmed operational capacity and compliance
- R-04: Bridge security: guardians identified, multisig tested, emergency procedures documented
- R-05: Stablecoin issuers confirmed (>=2): USDC/CCTP and institutional stable
- R-06: Oracle infrastructure live: Chainlink, backup feeds, fallback mechanism tested
- R-07: Governance: emergency council elected, proposal templates prepared
- R-08: Monitoring & alerts: mainnet dashboards, slashing alerts, bridge health checks
- R-09: Communications: disclosure plan, incident response runbook, validator SLAs
- R-10: Insurance & mitigation: fund established ($10M), coverage documented

Go/No-Go Scoring

Dimension	Weight	Threshold
Security (audits, testing)	30%	>=90%
Performance (TPS, latency)	20%	>=95%
Economics (incentives, sustainability)	15%	>=85%
Operations (uptime, monitoring)	15%	>=90%
Ecosystem (validators, apps)	10%	>=80%
Governance (voting, timelocks)	10%	>=75%

Decision rule: Total score >=80% = GO, any blocking check failed = NO-GO. Chain Maturity: Launch (0–2w), Early Ops (2–6w), Stable (6–12w), Mature (12w+).

26. Key Dates & Milestones

Phase	Timeline	Key Events
Seed Round	Mar–Apr 2026	Investor signings, legal closure
Community Launch	Mar 2026	Website, Discord, documentation live
Testnet (Echo)	May 2026	Public validator signup, faucet
Echo Testnet	Jun–Jul 2026	Load testing, bridge testing
Strategic Round	Sep–Oct 2026	Strategic investor close
Exchange Snapshot	Nov 2026	Preparing CEX listing data
TGE Window	Dec 7–10, 2026	Token generation event
Mainnet Launch	Q1 2027	Public mainnet opens

27. Competitive Benchmarks

L1 Comparison

Chain	Team %	Float %	Airdrop %	FDV
Sui	20%	5%	6%	$2B
Aptos	20%	13%	51%	$1B
Celestia	20%	20%	7.4%	$300M
Arbitrum	27%	12%	12.75%	$1.4B
Aethelred	20%	6.3%	7%	$1B (target)

Aethelred's allocation balances investor protection (float cap), community engagement (airdrop), and long-term alignment (team & foundation). The 20% team allocation ensures founder commitment while the 6.3% float provides market liquidity without excessive dilution.

28. Risk Factors & Mitigations

TGE Dump Risk (Likelihood: Medium, Impact: High)

Mitigation: Graduated unlock schedule, validator stake-locking, community education

Geopolitical Risk (Likelihood: Medium, Impact: Medium)

Mitigation: OFAC compliance, jurisdictional diversification, legal counsel

Hiring Risk (Likelihood: Low, Impact: High)

Mitigation: Competitive compensation, grant vesting, advisory board recruitment

Exchange Listing (Likelihood: Low, Impact: High)

Mitigation: Pre-negotiated terms, liquidity provision agreements

Testnet Delay (Likelihood: Medium, Impact: Medium)

Mitigation: Phased milestones, extended timeline buffers

Smart Contract Exploit (Likelihood: Low, Impact: Catastrophic)

Mitigation: Multi-cycle audits, insurance fund, emergency pause

Regulatory Uncertainty (Likelihood: Medium, Impact: Medium)

Mitigation: ADGM registration, legal framework alignment

29. Long-Term Economic Sustainability

Revenue Model

Aethelred's revenue comes from four sources: AI compute market fees (40% to validators), bridge transaction fees (2–5 bps), institutional stablecoin routing (variable), and tensor precompile gas fees.

Equilibrium Economics

Year 1: 0% inflation, PoUW distribution offset by burn mechanisms. Net deflationary through year 10. 55% of tokens staked. 3–6% APY for validators. Fee-only revenue model enables self-sustaining ecosystem without continuous token emission.

Supply Trajectory

Years 1–10: PoUW distribution (~25M/month) offset by burn mechanisms (base fee, congestion, adaptive). Supply monotonically non-increasing after burn ramp-up (month 6). **Year 10+:** Fee-only revenue model sustains validators. **Long-term:** Supply asymptotically approaches floor as transaction volume stabilizes.

30. Regulatory Compliance Design

OFAC & Sanctions

Aethelred implements OFAC-compliant screening via address blacklisting, batch verification (200 addresses), compliance burns with reason codes, and transfer restrictions on sanctioned entities.

Governance Timelocks

Action	Timelock	Purpose
Protocol upgrades	27 days	Community review, validator migration
Key rotation	7 days	Security event response
Ecosystem fund allocation	48 hours	Treasury management
Emergency bridge pause	48 hours	Bridge security incident
Contingency mode activation	30 days	Chain halt mitigation

Multi-Signature Requirements

Control	Threshold	Signers
Token admin (pausing)	4-of-7	Founders + external governance
Bridge guardians	2-of-N	Validator subset
Ecosystem fund	4-of-7	Foundation trustees
Stablecoin keys	3-of-5	Issuer, auditor, guardian
Insurance fund	3-of-5	Coverage managers
Key rotation dual-sig	2-of-2	Hot + cold wallets

Audit Trail: All economically significant events indexed: token mints, burns, slashing, bridge transactions, governance votes, parameter changes. Full event logs available for regulatory review.

Appendix A — Parameter Reference

A.1 Token Parameters

Parameter	Value	Unit
Total Supply Cap	10,000,000,000	AETHEL
Decimal Precision	18	places
Minimum Transfer	1	uaethel
Pause Function	Yes	boolean
Burnable	Yes	boolean
Vesting Enabled	Yes	boolean
Blacklist Size	500–5000	addresses
Initial Circulating	630,000,000	AETHEL
Year 1 Inflation	0%	%
Vesting Cliff	6 months (team)	duration

A.2 Allocation Categories

Category	Percentage	Vesting	Lock Period
Team	20%	4 years, 6m cliff	12 months
Advisors	3%	3 years, 3m cliff	6 months
Seed Investors	10%	2 years, 3m cliff	3 months
Community (Airdrop)	7%	1 year, linear	TGE
Staking Rewards Pool	25%	Monthly release	N/A
Foundation Reserve	15%	Locked, governance	27 days (timelock)
Treasury	10%	Governance-controlled	48 hours (timelock)
Liquidity Provision	10%	N/A	N/A

A.3 Fee Parameters

Parameter	Value
Base Fee (standard tx)	0.001 AETHEL
Base Fee (compute job)	0.01 AETHEL
Priority Multiplier Range	1x–5x
Hardware Multiplier Range	1x–2x
Jurisdiction Multiplier Range	1x–1.5x
Base Fee Burn Rate	20%
Validator Commission Range	5%–20%

A.4 Staking Parameters

Parameter	Value
Min Validator Stake	50,000 AETHEL
Min Delegator Stake	10 AETHEL
Unstaking Period	28 days
Redelegation Delay	7 days
Target Staking Ratio	55%
APY (baseline)	3–6%
Commission Min	5%
Commission Max	20%
Self-Delegation Requirement	20% of validator stake
Maximum Validators	500

A.5 Slashing Parameters

Parameter	Value
Downtime Slash	0.01%
Double-Sign Slash	5%
Equivocation Slash	10%
Invalid Consensus Slash	25%
Bridge Exploit Slash	50%
Slashing Window	10,000 blocks
Validator Jailing Period	1 week
Slash Distribution	50% burn, 50% reporter reward

A.6 Bridge Parameters

Parameter	Value
Min Deposit	0.01 ETH
Max Deposit	100 ETH
Hourly Rate Limit	1000 ETH
Challenge Period	7 days
Confirmations Required	64 ETH blocks
Guardian Multisig	2-of-N
Upgrade Timelock	27 days
Per-Block Mint Ceiling	10 ETH

A.7 Fundraising Parameters

Round	Size	Price	Vesting
Seed	$20M	$0.05/AETHEL	2y + 3m cliff
Community	$10M	$0.10/AETHEL (avg)	1y, linear
Strategic	$15M	$0.15/AETHEL (avg)	1.5y + 3m cliff
Exchange	N/A	Market TBD	N/A
Total Raise	$45M+	~$0.10 avg	—
Seed Dilution	10%	Post-raise	—
Strategic Dilution	8%	Post-raise	—

A.8 Governance Parameters

Parameter	Value
Voting Period (bootstrap)	3.5 days
Voting Period (active)	7 days
Quorum (bootstrap)	33%
Quorum (active)	40%
Approval Threshold	66.67%
Council Size	9 members
Council Term	1 year (staggered 3 annually)
Max Proposals	20

Appendix B — Mathematical Proofs

B.1 Supply Boundedness

Let S(t) be total supply at time t, B(t) be cumulative burned tokens. S(t) = S0 - B(t), where S0 = 10B AETHEL. Since B(t) is monotonically non-decreasing, S(t) is monotonically non-increasing. Therefore, S(t) <= S0 for all t >= 0. Long-term limit: S(∞) = S0 - B(∞) remains bounded below by 0 and above by S0.

B.2 Slashing Deterrence

Slashing formula: slash_amount = staked x slash_bps / 10000. Deterrence ratio = max_gain / slash_amount. For attack on 2/3+1 supermajority: max_gain = (token_price x capital_acquisition_cost), slash_amount = (capital x slash_pct). With slash_pct = 5%–50% depending on attack severity, and capital_cost = market_value, ratio = (market_value x gain_multiple) / (market_value x 0.05–0.50) = 20–200x. Therefore deterrence ratio > 1 for all practical attacks.

B.3 Vesting Monotonicity

Vesting schedule v(t) is piecewise-linear: v(t) = 0 for t <= cliff_time, v(t) = (t - cliff) / vesting_duration x total_amount for cliff_time < t <= cliff_time + vesting_duration, v(t) = total_amount for t > cliff_time + vesting_duration. First derivative: dv/dt >= 0 on all intervals. Continuity at transition points: lim_{t->cliff+} dv/dt = total_amount / vesting_duration (positive, continuous). Therefore v(t) is monotonically non-decreasing with continuous first derivative (C^1 continuous).

Document Control & Compliance

Field	Value
Document Title	Aethelred Tokenomics v2.0
Version	2.0
Date	March 11, 2026
Prepared By	Aethelred Foundation
Prepared By (Individual)	Ramesh Tamilselvan
Classification	Confidential — For ADGM DLT Foundation Registration
Distribution	Restricted to authorized investors and regulators
Regulatory Framework	ADGM DLT Regulatory Framework v1.0
Jurisdiction	Abu Dhabi Global Market (ADGM)
Next Review	Post-Seed Close

Legal Disclaimer

Confidentiality and Restrictions: This document contains confidential and proprietary information regarding Aethelred Foundation and its tokenomics design. It is intended solely for authorized recipients and may not be disclosed, reproduced, or distributed without explicit written consent.

Forward-Looking Statements: This document contains forward-looking statements regarding future token supply, price, market conditions, and protocol functionality. These statements are based on current assumptions and are subject to significant risks and uncertainties. Actual results may differ materially.

No Investment Advice: This document does not constitute investment advice, financial advice, or a recommendation to buy, sell, or hold AETHEL tokens. Recipients must conduct independent due diligence and consult qualified financial advisors.

Regulatory Risks: Token economics, staking, and governance may be subject to evolving regulatory requirements in ADGM, the UAE, and other jurisdictions. The Foundation reserves the right to modify tokenomics in response to regulatory guidance.

Technical Risks: Blockchain networks carry inherent technical risks including software bugs, network failures, and consensus attacks. The Foundation implements industry-leading security practices but cannot guarantee risk-free operation.

Economic Assumptions: Projections of token price, staking yield, and network fee revenue are estimates based on assumptions that may not materialize. Actual outcomes may differ significantly.

OFAC and Sanctions Compliance: Aethelred implements OFAC-compliant screening. Users and validators must comply with applicable sanctions and export control regulations.
