

Sovereign Data, Verified for Export

Tier-2 workloads and the cross-border deals they unlock

M42's models are valuable, but its data, diagnostics, trials, and Med42 governance assets are the larger prize - and each can be sold or licensed internationally only when a foreign buyer, regulator, or partner can verify the result without seeing the underlying records. That verification is the product. Each Tier-2 workload produces a Digital Seal that supplies exactly the proof the counterparty requires, turning a stalled conversation into a clearable deal.

Workload	M42 asset	Cross-border deal it unlocks	What the Digital Seal proves
De-identification & data-egress attestation	Malaffi, BioBank, genome data	De-identified data licensing to foreign pharma and research consortia; TELUS-style international data collaborations	PHI removed (recall $\geq 98\%$), zero residual PHI in the released set, k-anonymity ≥ 5 - before any record leaves the boundary
Malaffi population-health & RWE	ADHDS / Malaffi HIE - 3.5M records, 3,000+ facilities	Regulatory-grade real-world evidence sold to biopharma; Malaffi/Sahatna HIE licensed to other governments	The cohort query ran on approved data, in-boundary, with a stated differential-privacy budget and 100% small-cell suppression - no record exposed
Biobank GWAS & polygenic risk scores	Emirati Genome Programme - 700K genomes	Biopharma target-discovery and PRS licensing on the sovereign cohort	Association power $\geq 80\%$, FDR $\leq 5\%$, genomic inflation controlled ($\lambda \leq 1.10$) - the cohort never left Abu Dhabi
Digital pathology AI	National Reference Laboratory	Cross-border diagnostic reads and second-opinion services	Slide AUROC ≥ 0.90 , sensitivity ≥ 0.95 , with the model and circuit hash bound to each slide read the receiving clinician can audit
Clinical-trial matching & synthetic control arms	IROS	Multi-site international trials and pharma trial partnerships	Eligibility matched at high sensitivity with a balanced synthetic control arm (covariate SMD ≤ 0.10) a regulator can accept in lieu of randomization
Med42 training / fine-tuning provenance	Med42 + Core42 / Cerebras	Licensing Med42 into other jurisdictions; defending its IP	Which approved, consented data trained the checkpoint - zero unapproved data included, complete lineage, bound to the checkpoint hash

The through-line. De-identification attestation is the master key: no data asset clears a foreign residency or consent review until M42 can prove safe egress. The other five each convert a specific M42 asset into recurring, cross-border revenue by replacing "trust M42's word" with "verify the Seal."

Boundary. Pilot evidence is synthetic and pre-testnet; the metrics above are drill results computed on synthetic ground truth, not clinical, scientific, or production claims. Live deals follow the paid pilot, ADGM entity registration, and M42 governance approval.
